

Delete a node from BST

Case 1:- May be leaf.

Fig:-

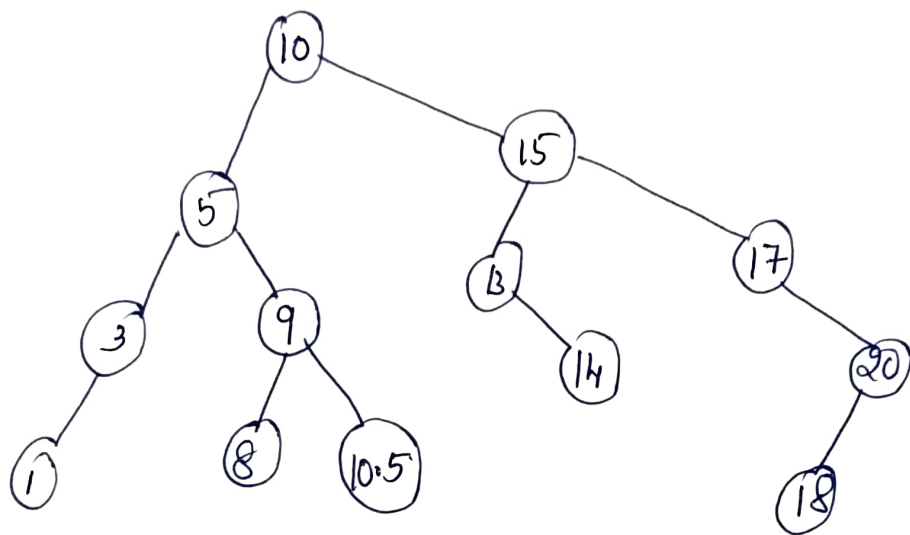

Here I delete leaf 0 then tree looks like

Case 2:- There is right subtree but not left subtree.

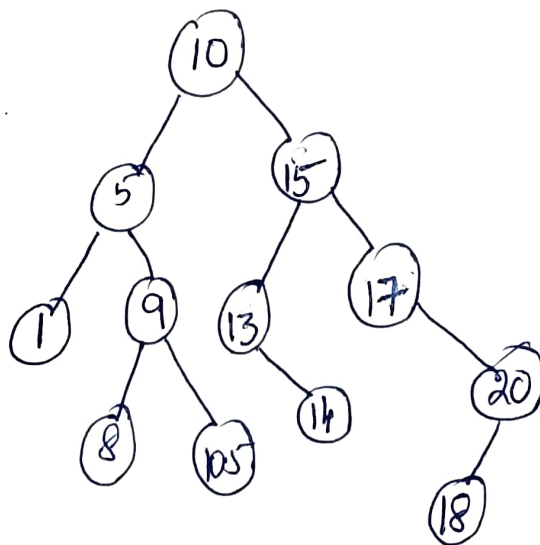

Eg:- Consider Node 7.

Then when you delete this type of node connect the child of the deleted node to parent of deleted node.

Case 3:- There exist left subtree but not right subtree.

Eg:- Node 3, connect child of this to parent of 3

Case 4:- Non Empty left subtree & non Empty right subtree,

Eg:- Here the element 15, delete 15.

In this case Find the minimum element in the right tree then replace with that value.

So here out of 17, 20 & 18, 17 is the minimum.

Or select max element in the right subtree
